Make the most of what today's technology has to offer in human services education! Distance education presents special challenges to social work education. Using Technology in Human Services Education: Going the Distance provides case studies and practical research on making the best use of this powerful new tool for teaching. Designed for both practitioners and educators, this fascinating book examines the use of technology in education and practice in the field of social work and other human services. Because setting up distance-learning programs can be expensive, Using Technology in Human Services Education suggests ways to reduce the impact on the budget, including setting up a consortium to merge resources with other schools. It also shows how to integrate traditional instructional approaches with the new technologies, how to make use of email and electronic discussion groups, and how to use the Internet to hone practice-related skills. In addition, it covers the current status of the technology itself. Using Technology in Human Services Education: Going the Distance explores ways to maximize the potential of distance education, such as: a framework for designing distance education courses that fully utilize the

unique environments these courses offer a discussion of the impact of technological tools in teaching specific course content ways that SACs (Site Advisory Committees) can increase students' socialization into their new professions ways that students need to be supported in order to feel a connection to a distance-learning program the use of GIS (Geographic Information Systems) to help meet and identify the information needs of a field placement agency Using Technology in Human Services Education offers creative approaches and practical advice for making the best use of the technology. Whatever your level of computer skill, from novice to hacker, this book will give you ideas you can use. No individual or institution interested in maintaining top quality in human services education should be without this book!

Elementary Statistics has been written for the introductory statistics course and students majoring in any field. Although the use of algebra is minimal, students should have completed at least an elementary algebra course. In many cases, underlying theory is included, but this book does not stress the mathematical rigor more suitable for mathematics majors. Triola is the #1

best seller in the market long recognized for its student-friendly pedagogy and wealth of exercises using real data. The ninth edition offers new large and small data sets, a greater emphasis on interpreting results, and improved flexible technology coverage with many examples and exercises covering a wide variety of different and interesting statistical applications.

Wireless Sensor Network Technologies

for Information Explosion Era

The amount and value of information available due to rapid spread of information technology is exploding.

Typically, large enterprises have approximately a petabyte of operational data stored in hundreds of data repositories supporting thousands of applications. Data storage volumes grow in excess of 50% annually. This growth is expected to continue due to vast proliferation of existing information systems and the introduction of new data sources. Wireless Sensor Networks (WSNs) represent one of the most notable examples of such new data sources. In recent few years, various types of WSNs have been deployed and the amount of information generated by wireless sensors increases rapidly. The information explosion requires establishing novel data processing and communication techniques for WSNs. This volume aims to cover both theoretical and practical aspects related to this challenge, and it explores directions for future research to enable efficient utilization of WSNs in the information-explosion era. The book is organized in three main parts that consider (1) technical issues of WSNs, (2) the integration of multiple WSNs, and

(3) the development of WSNs systems and testbeds for conducting practical experiments. Each part consists of three chapters.

"Each country's resources fall into three categories: General Business, General

Research, and Advertising and Marketing. The General Business category provides Internet resources on e-commerce, Internet, or international trade environments, as well as electronic marketplaces. The General Research category consists mostly of Internet resources that provide market research and statistical information about a country's economic and social well-being, general statistical methodology resources are also included. The Advertising and Marketing category contains resources with information on advertising and marketing industries."--BOOK JACKET.

This State-of-the-Art Survey contains a selection of papers representing state-of-the-art results in the engineering of secure software-based Future Internet services and systems, produced by the NESSoS project researchers. The engineering approach of the Network of Excellence NESSoS, funded by the European Commission, is based on the principle of addressing security concerns from the very beginning in all software development phases, thus contributing to reduce the amount of software vulnerabilities and enabling the systematic treatment of security needs through the engineering process. The 15 papers included in this volume deal with the main NESSoS research areas: security requirements for Future Internet services; creating secure service architectures and secure service design; supporting programming environments for secure and composable services; enabling security assurance and integrating former results in a risk-aware and cost-aware software life-cycle. *SPEEDEE* EXPRESS *Spotlight* Addison-Wesley

• New York Times bestseller • The 100 most substantive solutions to reverse global warming, based on meticulous research by leading scientists and policymakers around the world “At this point in time, the Drawdown book is exactly what is needed; a credible, conservative solution-by-solution narrative that we can do it. Reading it is an effective inoculation against the widespread perception of doom that humanity cannot and will not solve the climate crisis. Reported by-effects include increased determination and a sense of grounded hope.” —Per Espen Stoknes, Author, *What We Think About When We Try Not To Think About Global Warming* “There’s been no real way for ordinary people to get an understanding of what they can do and what impact it can have. There remains no single, comprehensive, reliable compendium of carbon-reduction solutions across sectors. At least until now. . . . The public is hungry for this kind of practical wisdom.” —David Roberts, *Vox* “This is the ideal environmental sciences textbook—only it is too interesting and inspiring to be called a textbook.” —Peter Kareiva, Director of the Institute of the Environment and Sustainability, UCLA In the face of widespread fear and apathy, an international coalition of researchers, professionals, and scientists have come together to offer a set of realistic and bold solutions to climate change. One hundred techniques and practices are described here—some are well known; some you may have never heard of. They range from clean energy to educating girls in lower-income countries to land use practices that pull carbon out of the air. The solutions exist, are economically viable, and communities throughout the world are currently enacting them with skill and

determination. If deployed collectively on a global scale over the next thirty years, they represent a credible path forward, not just to slow the earth’s warming but to reach drawdown, that point in time when greenhouse gases in the atmosphere peak and begin to decline. These measures promise cascading benefits to human health, security, prosperity, and well-being—giving us every reason to see this planetary crisis as an opportunity to create a just and livable world.

This book provides a comprehensive view of the methods and approaches for performance evaluation of computer networks. It offers a clear and logical introduction to the topic, covering both fundamental concepts and practical aspects. It enables the reader to answer a series of questions regarding performance evaluation in modern computer networking scenarios, such as 'What, where, and when to measure?', 'Which time scale is more appropriate

for a particular measurement and analysis?', 'Experimentation, simulation or emulation? Why?', and 'How do I best design a sound performance evaluation plan?'. The book includes concrete examples and applications in the important aspects of experimentation, simulation and emulation, and analytical modeling, with strong support from the scientific literature. It enables the identification of common shortcomings and highlights where students, researchers, and engineers should focus to conduct sound performance evaluation. This book is a useful guide to advanced undergraduates and graduate students, network engineers, and researchers who plan and design proper performance evaluation of computer networks and services. Previous knowledge of computer networks concepts, mechanisms, and protocols is assumed. Although the book provides a quick review on applied statistics in computer networking, familiarity with basic statistics is an asset. It is suitable for advanced courses on computer networking as well as for more specific courses as a secondary textbook.
