Global Marketing, 3rd edition, provides students with a truly international treatment of the key principles that every marketing manager should grasp. International markets present different challenges that require a marketer to think strategically and apply tools and techniques creatively in order to respond decisively within a fiercely competitive environment. Alon et al. provide students with everything they need to rise to the challenge: Coverage of small and medium enterprises, as well as multinational corporations, where much of the growth in international trade and global marketing has occurred; A shift toward greater consideration of services marketing as more companies move away from manufacturing; A shift from developed markets to emerging markets with more dynamic environments; A focus on emerging markets to equip students with the skills necessary to take advantage of the opportunities that these rapidly growing regions present; Chapters on social media, innovation, and technology teaching students how to incorporate these new tools into their marketing strategy; New material on sustainability, ethics, and corporate social responsibility—key values for any modern business; Short and long cases and examples throughout the text show students how these principles and techniques are applied in the real world. Covering key topics not found in competing books, Global Marketing will equip today's students with the knowledge and confidence they need to become leading marketing managers. A companion website features an instructor's manual with test questions, as well as additional exercises and examples for in-class use.

Everything you've always wanted to know about self-driving cars, Netflix recommendations, IBM's Watson, and video game-playing computer programs. The future is here: Self-driving cars are on the streets, an algorithm gives you movie and TV recommendations, IBM's Watson triumphed on Jeopardy over puny human brains, computer programs can be trained to play Atari games. But how do all these things work? In this book, Sean Gerrish offers an engaging and accessible overview of the breakthroughs in artificial intelligence and machine learning that have made today's machines so smart. Gerrish outlines some of the key ideas that enable intelligent machines to perceive

and interact with the world. He describes the software architecture that allows self-driving cars to stay on the road and to navigate crowded urban environments; the million-dollar Netflix competition for a better recommendation engine (which had an unexpected ending); and how programmers trained computers to perform certain behaviors by offering them treats, as if they were training a dog. He explains how artificial neural networks enable computers to perceive the world—and to play Atari video games better than humans. He explains Watson's famous victory on Jeopardy, and he looks at how computers play games, describing AlphaGo and Deep Blue, which beat reigning world champions at the strategy games of Go and chess. Computers have not yet mastered everything, however; Gerrish outlines the difficulties in creating intelligent agents that can successfully play video games like StarCraft that have evaded solution—at least for now. Gerrish weaves the stories behind these breakthroughs into the narrative, introducing readers to many of the researchers involved, and keeping technical details to a minimum. Science and technology buffs will find this book an essential guide to a future in which machines can outsmart people.

Technological change is a central feature of modern societies and a powerful source for social change. There is an urgent task to direct these new technologies towards sustainability, but society lacks perspectives, instruments and policies to accomplish this. There is no blueprint for a sustainable future, and it is necessary to experiment with alternative paths that seem promising. Various new transport technologies promise to bring sustainability benefits. But as this book

shows, important lessons are often overlooked because the experiments are not designed to challenge the basic assumptions about established patterns of transport choices. Learning how to organise the process of innovation implementation is essential if the maximum impact is to be achieved - it is here that strategic niche management offers new perspectives. The book uses a series of eight recent experiments with electric vehicles, carsharing schemes, bicycle pools and fleet management to illustrate the means by which technological change must be closely linked to social change if successful implementation is to take place. The basic divide between proponents of technological fixes and those in favour of behavioural change needs to be bridged, perhaps indicating a third way.
