This guideline provides updated global, evidence-informed recommendations on the

intake of free sugars to reduce the risk of NCDs in adults and children, with a particular focus on the prevention and control of unhealthy weight gain and dental caries. The recommendations in this guideline can be used by policy-makers and programme managers to assess current intake levels of free sugars in their countries relative to a benchmark. They can also be used to develop measures to decrease intake of free sugars, where necessary, through a range of public health

interventions. Examples of such interventions and measures that are already being implemented by countries include food and nutrition labelling, consumer education, regulation of marketing of food and non-alcoholic beverages that are high in free sugars, and fiscal policies targeting foods and beverages that are high in free sugars. This guideline should be used in conjunction with other nutrient guidelines and dietary goals, in particular those related to fats and fatty acids (including

saturated fatty acids and trans-fatty acids), to guide development of effective public health nutrition policies and programmes to promote a healthy diet.

YOUNG KERALAITE EYES IN CYBERSEX World Health Organization

Worldwide economic constraints on health care systems have highlighted the importance of evidence-based medicine and evidence-based health policy. The resulting clinical trials and health services research studies require instruments to monitor

the outcomes of care and the output of the health system. However, the over-abundance of competing measurement scales can make choosing a measure difficult at best. Measuring Health provides in-depth reviews of over 100 of the leading health measurement tools and serves as a guide for choosing among them. Now in its third edition, this book provides a critical overview of the field of health measurement, with a technical introduction and discussion of the history

and future directions for the field. This latest edition updates the information on each of the measures previously reviewed, and includes a complete new chapter on anxiety measurement to accompany the one on depression. It has also added new instruments to those previously reviewed in each of the chapters in the book. Chapters cover measurements of physical disability, social health, psychological well-being, anxiety, depression, mental status testing, pain, general health

status and quality of life. Each chapter presents a tabular comparison of the quality of the instruments reviewed, followed by a detailed description of each method, covering its purpose and conceptual basis, its reliability and validity and, where possible, shows a copy of the actual scale. To ensure accuracy of the information, each review has been approved by the original author of each instrument or by an acknowledged expert.

Featuring contributions from some of the leading researchers in the field of SEM, most chapters are written by the author(s) who originally proposed the technique and/or contributed substantially to its development. Content highlights include latent variable mixture modeling, multilevel modeling, interaction modeling, models for dealing with nonstandard and noncompliance

samples, the latest on the analysis of growth curve and longitudinal data, specification searches, item parceling, and equivalent models. This volume will appeal to educators, psychologists, biologists, business professionals, medical researchers, and other social and health scientists. It is assumed that the reader has mastered the equivalent of a graduate-level multivariate statistics course that included coverage of introductory SEM techniques.

Prevention of mental illness and mental health promotion have often been ignored in the past, both in undergraduate and postgraduate curricula. Recently, however, there has been a clear shift towards public mental health, as a result of increasing scientific evidence that both these actions have a serious potential to reduce the onset of illness and subsequent burden as a result of mental illness and related social,

economic and political costs. A clear distinction between prevention of mental illness and mental health promotion is critical. Selective prevention, both at societal and individual level, is an important way forward. The Oxford Textbook of Public Mental Health brings together the increasing interest in public mental health and the growing emphasis on the prevention of mental ill health and promotion of well-being into a single comprehensive textbook. Comprising international

experiences of mental health promotion and mental well-being, chapters are supplemented with practical examples and illustrations to provide the most relevant information succinctly. This book will serve as an essential resource for mental and public health professionals, as well as for commissioners of services, nurses and community health visitors. *Income Distribution Within Irish Households* Combat Poverty Agency
Today, as never before,

healthcare has the ability to enhance the quality and duration of life. At the same time, healthcare has become so costly that it can easily bankrupt governments and impoverish individuals and families. Health services research is a highly multidisciplinary field, including such areas as health administration, health economics, medical sociology, medicine, , political science, public health, and public policy. The Encyclopedia of Health Services Research is the

first single reference source to capture the diversity and complexity of the field. With more than 400 entries, these two volumes investigate the relationship between the factors of cost, quality, and access to healthcare and their impact upon medical outcomes such as death, disability, disease, discomfort, and dissatisfaction with care.  This book is divided into
 two main sections, and
 covers a broad range of
 issues important for
 health practitioners to be
 aware of when caring for
 people with co-morbid
 diabetes and depression.
 Section One of the book
 contains the overall ideas
 and the more recent
 developments in

measuring psychological morbidity in people with diabetes. When attempting to identify people with depression or other psychological problems, it is important for practitioners to recognize the limitations of screening as well as its utility. Issues such as the basic principles regarding when and when not to screen, the cultural applicability of tools, different questionnaire formats and key concepts such as sensitivity and specificity of tools, and their positive and

negative predictive value, will be considered. In particular there has been increased interest in the concept of diabetes-related distress and several tools have been developed to measure this. There are broad-based measures of distress such as the Problem Areas in Diabetes (PAID) scale, the Diabetes Adjustment Scale (DAS), The Diabetes Health Profile, The Fear of Hypoglycemia Scale, etc. There are also a range of generic quality of life tools which have been used

effectively in people with diabetes; for example the Medical Outcomes Survey Short-Forms (SF36, SF12), the World Health Organisation Well-being questionnaire (WHO-5) and the EQ5-D. These tools are important because they measure aspects of psychological well-being that are specifically associated with the experience of having a long-term conditions and so have important implications for both self-care and health care practice. The potential overlap of

symptoms of depression and symptoms of diabetes-related distress are considered in this section and the implications for practice discussed. Section Two covers the most commonly used tools that have been used to screen for depression. For each tool considered some information which is easily referred to by the reader is set out in a table which includes details of the authors, time of first use, country where it was first developed, some examples of the questions

used, the languages it is available in, data on sensitivity/specificity. Each instrument will then be discussed in terms of its use in research as well as practice, and its applicability in different patient groups, different cultural settings and so on. Guidance on the practical use of each tool is included, and the most popular depression screening tools are focussed on.

Following in the groundbreaking path of its predecessor, the second edition of the Social Workers' Desk Reference provides reliable and highly accessible information about effective services and treatment approaches across the full spectrum of social work practice. Succinct, illuminating chapters written by the field's most respected and experienced scholars and practitioners ensure that it will continue to be the sourcebook for all social

workers. Social work practitioners and agency administrators are increasingly confronted with having to do more with less, and must make decisions and provide services as quickly as possible. The Social Workers' Desk Reference, Second Edition, builds on the landmark achievement of the first edition with thorough revisions and over 75 all-new chapters. Its outstanding wealth of well-tested knowledge, presented in a crisp, to-the-point manner, makes

it an even more vital resource for time-pressed practitioners. Page after page offers an abundance of up-to-date information and key tools and resources such as practice guidelines, program evaluations, validated assessment scales, and step-by-step treatment plans necessary for success in today's managed-care environment. The growing importance of evidence-based practice in social work is reflected throughout the chapters, as well as by the inclusion

of an entire section devoted to showing how to use evidence intelligently and efficaciously. The Social Workers' Desk Reference, Second Edition, speaks directly to the daily realities of social workers in private, non-profit, and public settings, whatever their expertise and in all areas of practice: assessment and diagnosis, ethics, risk assessment, program evaluation, and beyond. Case managers, clinical social workers, supervisors, and

administrators alike who have come to rely on the previous volume will quickly find its successor just as indispensable.

Decision making is a critical element in the field of medicine that can lead to life-or-death outcomes, yet it is an element fraught with complex and conflicting variables, diagnostic and therapeutic uncertainties, patient preferences and values, and costs.

Together, decisions made by physicians, patients, insurers, and policymakers determine the quality of health care, quality that depends inherently on counterbalancing risks and benefits and competing objectives such as maximizing life expectancy versus optimizing quality of life or quality of care versus economic realities. Broadly speaking, concepts in medical decision making (MDM) may be divided into two major categories:

prescriptive and descriptive. Work in the area of prescriptive MDM investigates how medical decisions should be done using complicated analyses and algorithms to determine cost-effectiveness measures, prediction methods, and so on. In contrast, descriptive MDM studies how decisions actually are made involving human judgment, biases, social influences, patient factors, and so on. The Encyclopedia of Medical Decision Making gives a gentle introduction to

both categories, revealing how medical and healthcare decisions are actually made—and constrained—and how physician, healthcare management, and patient decision making can be improved to optimize health outcomes. Key Features Discusses very general issues that span many aspects of MDM, including bioethics; health policy and economics; disaster simulation modeling; medical informatics; the psychology of decision making; shared and team

medical decision making; social, moral, and religious factors; end-of-life decision making; assessing patient preference and patient adherence; and more Incorporates both quantity and quality of life in optimizing a medical decision Considers characteristics of the decisionmaker and how those characteristics influence their decisions Presents outcome measures to judge the quality or impact of a medical decision Examines some of the

more commonly encountered biostatistical methods used in prescriptive decision making Provides utility assessment techniques that facilitate quantitative medical decision making Addresses the many different assumption perspectives the decision maker might choose from when trying to optimize a decision Offers mechanisms for defining MDM algorithms With comprehensive and authoritative coverage by experts in the fields of medicine, decision

science and cognitive psychology, and healthcare management, this two-volume Encyclopedia is a must-have resource for any academic library. Workers' compensation data in a large public sector human service agency clearly indicated that the most significant type of compensable incident that occurred

within the organisation was that of anxiety and stress related conditions. From September 1987 to September 1995, there had been 219 workers compensation claims relating to workplace strain (stress) in the agency. The total cost of these claims was \$4,865,249. A study was commissioned by the agency in early 1996 to review workplace strain. The outcomes sought by the department following the implementation of the project recommendations, as outlined in the project

briefwere to have: 1. a reduction of psychological and physical injuries of employees; 2. shorter duration of claims; 3. a reduction in the costs of claims; 4. a potential drop in sick leave; 5. a reduction in non compensable measures of occupational strain eg, absenteeism, poor performance, work flow interference, staffturnover, replacement and training costs; 6. managers and staffto be more aware of their role in preventing strain, contributing to

strain, and managing strain; 7. managers to know ofand use a range of resources to assist them with occupational strain issues, eg, Occupational Health and Safety Advisor, and StaffCounsellor; and 8. staff to have a clear means and strategies to assist them with occupational strain and avenues to resolve conflict. Assessing the Multidimensionality of the 12-item General Health Questionnaire

John Wiley & Sons
The book offers a comprehensive and up-to-date overview of key issues in perinatal mental health. Classic topics such as screening, assessment, pharmacological, psychological and psychosocial interventions of the most common conditions (depression, anxiety disorders, etc.) are combined with lesser known issues, such as mother-infant relationship disorders or thoughts of infant-related harm and aggressive behaviors, sleep disturbances in

puerperium, obsessional disorders, fetal death etc., paying particular attention to specific groups of perinatal patients like mothers with cancer, adolescents, fathers, migrants, and preterm babies. The chapters written by health professionals working in hospitals, community services or voluntary agencies alternate with contributions from researchers whose fields of expertise include biology and neuroscience, diagnosis and special needs, treatment and

prognosis, etc., striking a balance between scientific investigation and clinical practice. The book offers a valuable tool for a wide range of professionals like psychiatrists, psychologists, gynecologists, midwives, oncologists, pediatricians, and social workers, who want to improve their clinical practice and the effectiveness of their treatment pathways using evidence from perinatal health research. The Psychology of Gender and Health: Conceptual and Applied Global Concerns examines the psychological aspects of the intersection between gender and health and the ways in which they relate to the health of individuals and populations. It demonstrates how gender should be strategically considered in the most routine research tasks—from establishing priorities, constructing theory, designing methodologies, in data interpretation, and how to

practically apply this information in clinical contexts. The topics covered in its chapters answer the needs of professionals, students, and faculty, providing an up-to-date conceptual tool that covers the relationships that exist between gender and health. The book will not only help users build expertise in psychology in gender and health, but also contribute to the awareness and training of psychologists as dynamic actors in the implementation of the

gender perspective in their studies, reflections, research, and health interventions. Offers specific literature on the gender perspective in health and psychology Addresses a broad and diverse audience, and its coverage is uniquely comprehensive Utilizes an intersectional approach to race, class, sexual orientation, nationality, disability status, and age Updates on the pressing concerns of gender violence Covers specific content on transgender and same-sex attracted

populations that includes a focus on men and masculinity Deals with hot topics on infertility, immigration, and HIV/AIDS India Migration Report 2021 McGraw-Hill Education (UK) This book presents the largest international study of psychological disorders seen in primary health care. Centres in fourteen countries participated in this investigation, including Brazil, Chile, China, India, Nigeria and the USA as well as several European countries. The study has shown how

people with mental disorders present their problems to doctors and how likely their disorders are to be detected and treated.

This book is concerned with human factors and ergonomics research and developments in the design and use of systems and devices for effective and safe healthcare delivery. It reports on approaches for improving healthcare devices so that they better fit to people's,

including special population's needs. It also covers assistive devices aimed at reducing occupational risks of health professionals as well as innovative strategies for error reduction, and more effective training and education methods for healthcare workers and professionals. Equal emphasis is given to digital technologies and to physical, cognitive and organizational aspects, which are considered in an integrated manner, so as to facilitate a systemic

approach for improving the quality and safety of healthcare service. The book also includes a special section dedicated to innovative strategies for assisting caregivers', patients', and people's needs during pandemic. Based on papers presented at the AHFE 2021 Conference on Human Factors and Ergonomics in Healthcare and Medical Devices, held virtually on 25–29 July, 2021, from USA, the book offers a timely reference guide to both researchers and healthcare

professionals involved in the design of medical systems and managing healthcare settings, as well as to healthcare counselors and global health organizations.

India Migration Report 2021 presents a detailed study on the health of migrants. It highlights major healthcare challenges faced by migrant labourers, especially in the context of the COVID-19 pandemic, which has forced authorities, policymakers and many other stakeholders to turn

their attention to healthcare delivery unlike ever before. Bringing to the fore the health status of the migrant population both before the pandemic and during the pandemic, the essays in this volume discuss • the ease of access of migrant labourers to primary healthcare services; • the safety challenges faced by migrant workers at their workplaces, their exposure to various physical and psychological health vulnerabilities, and prevalence of potentially

malignant health disorders and mental health issues among migrant labourers; • gendered access to healthcare, gender-based violence at workplaces and the gender-related perceptions on topics such as employment, decision-making and general attitude; • the role of decentralization and local self-government

institutions in enabling health systems to address health problems of migrants, government policies and programs aimed at providing welfare for return emigrants from the Gulf; • the vulnerabilities migrant workers have encountered across the Indian states during the pandemic, with regards to

food insecurity and psychological distress, and the type of support they received from various stakeholders. The volume will be of interest to scholars and researchers of development studies, economics, demography, sociology and social anthropology, and migration and diaspora studies.
