 Neuropathic pain is notoriously difficult to treat. Despite an explosion of research in recent years, few new treatments have made their way into the clinic. Why is progress so glacially slow? Where are the new and promising treatments? When will there be a breakthrough in understanding? To address these questions, the editors convened a unique meeting, bringing together leaders from academia and industry. No time was taken up in lectures: all the meeting time was spent in intensive discussions, and this book is the result. It contains the latest available information and provides a blueprint to

meet the challenges that lie ahead. It will be invaluable both to clinicians treating neuropathic pain and to researchers studying this difficult but important problem.

Our working conditions have undergone rapid and fundamental changes during the last few years. One example is the widespread use of the individual computer in the shop, office and home. Another major development is that women now hold many jobs that used to be in the male domain, and that many more women choose a life-long occupational career. Workforces, tasks, conditions and tools are changing. Many office and industrial workers are tied to human-machine systems. Repetitive work can create cumulative health problems such as the often reported visual strains, mental stress and physical injury. Proper ergonomic measures can avoid such harmful effects and instead promote health conditions which are both efficient and agreeable. In this latest edition of *Fitting the Task to the Human*, Professor Karl Kroemer has revised and updated the text and data while remaining true to the spirit of Professor Etienne Grandjean's earlier editions. This aim is, as before, to impart basic knowledge of occupational ergonomics in a straightforward and lucid fashion to those responsible for the design, management and safety of people in the workplace, and to those who study it.
