 SAP Expressions are used in many different places. Expressions are formed from several different kinds of elements. These are discussed in the sections on functions and variables. You must be connected to the database to evaluate expressions.

EXPRESSIONS - SAP COUNT(<expression>) returns the number of non-NULL values for that expression returned by the query. **COUNT(DISTINCT <expression_list>)** returns the number of distinct values for that expressions returned by the query, excluding rows with all NULL values for that expression. **MIN** . Returns the minimum value of the expression. **MEDIAN** Expressions - SAP Help Portal In SAP HANA, p1, e1, p2, e2 and e3 can be evaluated in any order. But let's assume for example's sake that p1 would always return TRUE, and e2 would always throw an exception. If the order chosen is p1 > e1 > p2 > e2 > e3, and since p1 returns TRUE, then e1 is evaluated and returned as the result of the CASE expression.

Expressions - SAP Help Portal SQL Script now supports SELECT as an SQL query within scalar expressions. If the SELECT statement returns a 1*1 result set (1 row and 1 column), that result set can be used directly as an expression.
