Designed to introduce senior undergraduates and graduate students in public health and nursing to the study of infectious disease, *Foundations of Infectious Disease: A Public Health Perspective* places the study of infectious diseases squarely into its social, historical, and scientific context to demonstrate how it applies to the public and community health setting. Beginning with an introductory chapter that surveys how infectious diseases have impacted human societies over the centuries, this broad descriptive text moves on to examine epidemiological concepts related to infectious disease, from outbreak and epidemic investigations, to study design infectious disease transmission and prevention. Subsequently, it delves into infectious disease topics of concern to today's public and community health professionals: sexually transmitted infections, foodborne infections, healthcare-acquired infections, and neglected tropical diseases.

New approaches to collapsed complex societies. The Maya. The Romans. The great dynasties of ancient China. It is generally believed that these once mighty empires eventually crumbled and disappeared. A recent trend in archaeology, however, focusing on what happened during and after the decline of once powerful regimes has found social resilience and transformation instead of collapse. In *Beyond Collapse: Archaeological Perspectives on Resilience, Revitalization, and Transformation in Complex Societies*, editor Ronald K. Faulseit gathers scholars with diverse theoretical perspectives to interpret how ancient civilizations responded to various stresses, including environmental change, warfare, and the fragmentation of political institutions.

Contributors discuss not only what makes societies collapse but also why some societies are resilient and others are not, as well as how societies reorganize after collapse. Putting in context issues we face today, such as climate change, social diversity, and the failure of modern states, *Beyond Collapse* is an essential volume for readers interested in human-environment interaction and in the collapse--and subsequent reorganization--of human societies.

HIV-Associated Immune Activation and Persistent Inflammation Elsevier Health Sciences

A successful vaccine for the prevention and/or immunotherapy against HIV/AIDS is one of the prominent challenges of the 21st century. To date, all human vaccine trials against this virus/disease have resulted in failure, or at best have shown very low efficacy. The scientific community dealing with HIV/AIDS has unanimously proposed a focus on basic science, with the intention of identifying correlates of protection that can serve as guides in developing and evaluating vaccine preparation. However, Nature seems to have already found several ways of dealing with infections by HIV and related primate lentiviruses, either by resisting infection or, once infected, avoiding immune damage and immunodeficiency. Models of Protection Against HIV/SIV will allow for an in-depth reflection on the perspectives for vaccine and therapy research derived from important recent studies. It will be authored by some of the most well known specialists in the field of HIV resistance/protection: including F. Barré-Sinoussi (2008 Nobel Prize for Medicine winner), B. Walker, S. Rowland-Jones, A. Telenti, M. Lederman and F. Plummer. This book is structured in a unique way, looking at three models of resistance/protection separately and then comparing the models against one another to provide its readership with a detailed examination of the research that is most predominant in the search for a vaccine. This structure presents the information in an easy-to-understand format and gives the book a cross-discipline appeal -- an important reference for those in the scientific community, medical care, public health and academia alike. Provides extensive descriptions and comparisons on the different models of protection against HIV/AIDS Comprehensive writing and illustrations Contributors are among the most eminent specialists in the field

HIV, An Issue of Infectious Disease Clinics of North America Funstory

HIV remains the major global health threat, and neither vaccine nor cure is available. Increasing our knowledge on HIV infection will help overcome the challenge of HIV/AIDS. This book covers several aspects of HIV-host interactions in vitro and in vivo. The first section covers the interaction between cellular components and HIV proteins, Integrase, Tat, and Nef. It also discusses the clinical relevance of HIV superinfection. The next two chapters focus on the role of innate immunity including dendritic cells and defensins in HIV infection followed by the section on the impact of host factors on HIV pathogenesis. The section of co-infection includes the impact of Human herpesvirus 6 and *Trichomonas vaginalis* on HIV infection. The final section focuses on generation of HIV molecular clones that can be used in macaques and the potential use of cotton rats for HIV studies.
