One of the most biologically rich environments on Earth, the coral reef dazzles our senses with its colors, shapes, and species diversity. Recreating living reefs in miniature is a burgeoning avocation for serious home aquarium keepers, and John Tullock here offers a new, radically simple approach to producing beautiful captive microcosms. Using live rock and live coral sand as part of a natural filtration system, the home aquarist can now mimic habitats such as a Florida Keys Lagoon, a Caribbean Turtle Grass Flat, an Indo-Pacific Deep Cave, or a Red Sea Patch Reef. With more than 200 color photographs and illustrations, **Natural Reef Aquariums** provides inspiration for both beginning and expert marine reef hobbyists. [The New Marine Aquarium](#) MIT Press

Any reef aquarium that contains less than 15 gallons of water is considered a nano-reef aquarium. These tiny ecosystems are almost as popular in the fishkeeping community as full-size marine aquarium setups, and with the proper information and tools, they can be set up and maintained by aquarists at any level of the hobby. The wide range of topics covered in this guide include the importance of water quality and tips on maintaining stable water parameters; components of a nano-reef and how to choose the appropriate aquarium, lighting, and accessories for a tank; which fish and invertebrates are best for

these types of tanks; and much, much more. For a reef enthusiast looking for a new challenge or any up-and-coming fish hobbyist, nano-reef aquariums are a stunningly beautiful option. The Nano-Reef Handbook contains all the information necessary to get started.

The conservation, sustainable use and development of aquatic genetic resources (AqGR) is critical to the future supply of fish. The State of the World's Aquatic Genetic Resources for Food and Agriculture is the first ever global assessment of these resources, with the scope of this first Report being limited to cultured AqGR and their wild relatives, within national jurisdiction. The Report draws on 92 reports from FAO member countries and five specially commissioned thematic background studies. The reporting countries are responsible for 96 percent of global aquaculture production. The Report sets the context with a review of the state of world's aquaculture and fisheries and includes overviews of the uses and exchanges of AqGR, the drivers and trends impacting AqGR and the extent of ex situ and in situ conservation efforts. The Report also investigates the roles of

stakeholders in AqGR and the levels of activity in research, education, training and extension, and reviews national policies and the levels of regional and international cooperation on AqGR. Finally, needs and challenges are assessed in the context of the findings from the data collected from the countries. The Report represents a snapshot of the present status of AqGR and forms a valuable technical reference document, particularly where it presents standardized key terminology and concepts.

The family-group names of animals (superfamily, family, subfamily, supertribe, tribe and subtribe) are regulated by the International Code of Zoological Nomenclature. Family names are particularly important because they are among the most widely used of all technical animal names. Apart from using the correct family-group name according to the Code, it is also important to use one unique universal name (with a fixed spelling) to avoid confusion. We have compiled a list of familygroup names for Recent fishes, applied the rules of the Code and, if possible, tried to conserve the names in prevailing recent practice. We list all

of the family-group names found to date for Recent fishes (N=2625), together with their author(s) and year of publication. This list can be used in assigning the correct family-group name to a genus or a group of genera. With this publication we contribute to the usage of correct, universal family-group names in the classification of, and for communication about, Recent fishes.
