The helicopter is truly a unique form of aircraft and a mastery of modern aeronau- tical

engineering that fulfills a variety of civilian and military roles. The usefulness of the helicopter lies in its unique ability to take off and land vertically on almost any terrain, to hover stationary relative to the ground, and to fly forward, backward, or sideways. Principles of Helicopter Aerodynamics The book contains the principles of helicopter flight, special characteristics of the main rotor and its function in autorotation axial and oblique flow, regimes of

vertical and horizontal flight, climb and descent, takeoff and landing, balance, stability and control of the helicopter and their acting aerodynamic forces. In order to get aircrafts that are "heavier than air" off the ground a force has to act upwards that is as least equal to the weight of the aircraft. Each rotor produces both lift and torque about its center of rotation, as well as drag opposite to the vehicle's direction of flight. Quadcopters generally have two rotors spinning clockwise (CW) and two counterclockwise (CCW).
