Bainite | Metallurgy for Dummies Martensite And Bainite In Steels If the steel is first quenched slightly under martensite start to form some fraction of martensite followed by reheating above martensite start, it has been found that the time required for bainite formation has been reduced in part because less austenite is present to transform and in part because the existing martensite increases the

nucleation rate for new bainite laths

[21]. Bainite vs

Martensite - The Secret to Ultimate Toughness ... Bainite is a plate-like microstructure that forms in steels at temperatures of 125–550 °C (depending on alloy content). First described by E. S. Davenport and Edgar Bain, it is one of the products that may form when austenite (the face-centered cubic crystal structure of iron) is cooled past a temperature where it no longer is thermodynamically stable with respect to ferrite, cementite, or

...Bainite -  
WikipediaMartensite is formed in steels when the cooling rate from austenite is sufficiently fast. It is a very hard constituent, due to the carbon which is trapped in solid solution. Unlike decomposition to ferrite and pearlite, the transformation to martensite does not involve atom diffusion, but rather occurs by a sudden diffusionless shear process.Austenite

Bainite in Steels - Harry Bhadeshia

1.1 Bainite in steels

Bainite in steels is usually referred to as a mixture of ferrite and carbide, in most cases cementite, decomposed from austenite. Discovery of bainite in steels was associated with the invention of isothermal heat treatment, which initiated many discoveries of decomposition of austenite in

1920-1930s. It may be thought of as a transformation product that is competitive with pearlite and bainite. The microstructure of martensite in steels has different morphologies and may appear as either lath martensite or plate martensite. For steel 0-0.6% carbon the martensite has the appearance of lath, and is called lath martensite.

### Steel - Composition and Properties

The microstructure of the as-built and HIP HSLA steels before and after cyclic re-austenitization consists of martensite, bainite, and martensite/retained austenite (M/A) islands. Figure 44: Optical micrograph of a mixed microstructure of bainite and martensite in a medium carbon steel. The bainite etched dark because it is a mixture of ferrite and cementite, and the  $\alpha$  /  $\theta$  interfaces are easily attacked by the nital etchant used.

*Bainite in Steels - Harry Bhadeshia*

Bainite possesses some of the features which are similar to pearlite reaction and have some of the characteristics of martensite. Though,

bainite is presumed to have its own 'C' type kinetics, the pearlite and bainite transformations overlap considerably in plain carbon and many low alloy steels.
