Example: What is Market Capitalization? Market capitalization refers to a company's total value. Analysts determine it by multiplying the number of shares in existence times the price of the stock. This concept can also be utilized to measure the full value of a stock exchange. The New York Stock Exchange market capitalization would equal the value of all publicly traded companies on the exchange added together. Market cap is another name for market capitalization. Examples of how this is figured make it easier to understand. Companies that have 2 million shares which have been issued that sell for \$20 apiece have a market cap of \$40 million. If an investor had enough money and could get the stockholders to agree to sell their shares, he or she could purchase the company for \$40 million total. In practice many shareholders would want more than the current share price to sell their stock. There are three different main sizes of market capitalization among traded companies. These are large cap, mid cap, and small cap corporations. Large cap companies are generally considered the least risky ones in which to invest. They typically possess substantial financial resources to survive economic downturns. They are also generally leaders in their industries. This gives them a smaller amount of growth opportunity. Because of this the returns for these large cap companies are often not as spectacular as with successful companies in the other two categories. They also have a significantly greater chance of paying dividends out to their share holders. Large cap corporations have \$5 billion and higher capitalization. Mid cap companies are generally less risky than the smaller companies.

They still do not have the same possibilities for aggressive growth. Mid cap companies commonly possess market capitalization of from \$1 billion to \$5 billion. Studies have shown that mid caps have outperformed large cap and small cap corporation stocks in the past 20 years. Small cap corporations are those which possess under \$1 billion in market capitalization. These tinier companies have often completed an Initial Public Offering in the recent past. Such companies are considered the riskiest of the three types. This is because in economic downturns, they have the greatest chance of failing or defaulting. They also enjoy plenty of opportunity and space to expand. This means that they potentially could be extremely profitable if they succeed. Trading. Click on the author name to see them. Example: What are Tax Exemptions? Tax exemptions are special monetary exemptions that decrease the amount of income which is taxable. This can take the form of full tax exempt status that delivers 100 percent relief from a certain form of taxes, partial tax on certain items, or reduced tax rates and bills. Tax exemption can refer to particular groups such as charitable outfits (who receive exemption from income taxes and property taxes), multi-jurisdictional businesses or individuals, and even military veterans. The phrase tax exemption is commonly utilized to refer to specific scenarios where the law lowers the amount of income that would fall under the taxable label otherwise. With the American Internal Revenue Service, there are two kinds of exemptions which are available to individuals. One example of a tax exemption concerns the decrease in taxes the IRS gives for any dependent children who are under age 18 (who actually live with the head of household income tax filer). For the year 2015, the Internal Revenue Service permitted individuals who were filing taxes to receive a \$4,000 exemption on every one of their permitted tax exemptions. This simply means that any individuals paying taxes who count on three permissible exemptions are able to deduct fully \$12,000 off of their taxable income level. In the cases where they make a higher amount than an IRS pre-determined threshold, the amount in tax exemptions which they are able to utilize becomes phased out slowly and finally eliminated completely. For the tax year 2015, those individuals filing taxes who earned in excess of \$258,250, as well as those married filing jointly couples who earned more than \$309,900, received a lower amount for their exemptions. This complicated sliding scale with seemingly random numbers in place is all part of the reason why observers claim the American tax system is outdated and overly complex. There is an important caveat for individuals filing taxes. They can not claim their own personal exemption when someone else claims them as a dependent on their tax return. This is one of the elements that separate exemptions from deductions in the world of tax terminology. Each individual filing is permitted to claim his or her personal deduction. Looking at a real world example helps to clarify the complicated rules. Young college students who have a job while they go to school will typically be claimed by their parents like a dependent on the parents' income tax return. Note: This example description is shorted due to publish restrictions. Each term is explained with 600 words and more.
