### **Consumer Action Handbook, 2010 Edition** No Starch Press

This volume presents case studies of U.S. and Russian peacekeeping and peacemaking operations since the end of the Cold War. The chapters are authored by U.S. and Russian policymakers and/or policy analysts who were neither direct participants in, nor first-hand observers of, the events they describe. Drawing on the evidence presented in the case studies, a concluding chapter compares the political and institutional arrangements and procedures through which the two countries decide whether or not to engage in peacekeeping and peacemaking operations and assesses the implications of the key similarities and differences for combined operations in the future.

### **Fictional Objects** Springer

By highlighting relations between experimental and theoretical work, this volume explores new ways of addressing one of the central challenges in the study of language and cognition. The articles bring together work by leading scholars and younger researchers in psychology, linguistics and philosophy. An introductory chapter lays out the background on concept composition, a problem that is stimulating much new research in cognitive science. Researchers in this interdisciplinary domain aim to explain how meanings of complex expressions are derived from simple lexical concepts and to show how these meanings connect to concept representations. Traditionally, much of the work on concept composition has been carried out within separate disciplines, where cognitive psychologists have concentrated on concept representations, and linguists and philosophers have focused on the meaning and use of logical operators. This volume demonstrates an important change in this situation, where convergence points between these three disciplines in cognitive science are emerging and are leading to new findings and theoretical insights. This book is open access under a CC BY license.

This handbook of drugs used in pediatric cardiac care will satisfy the need for a quick reference source of common drug therapy. There are no major texts available in the field of pediatric cardiology that exclusively provide therapeutic drug information. Several sources are available that present drug information for cardiology, but these place no emphasis on pediatric care and are written for general cardiac specialists.

### A Multidisciplinary Approach John Wiley & Sons

This book gathers papers addressing state-of-the-art research in all areas of information and communication technologies and their applications in intelligent computing, cloud storage, data mining and software analysis. It presents the outcomes of the Fourth International Conference on Information and Communication Technology for Intelligent Systems, which was held in Ahmedabad, India. Divided into two volumes, the book discusses the fundamentals of various data analysis techniques and algorithms, making it a valuable resource for researchers and practitioners alike. Springer Science & Business Media

This innovative modern physics textbook is intended as a first introduction to quantum mechanics and its applications. Townsend's new text shuns the historical ordering that characterizes other so-called modern physics textbooks and applies a truly modern approach to this subject, starting instead with contemporary single-photon and single-atom interference experiments. The text progresses naturally from a thorough introduction to wave mechanics through applications of quantum mechanics to solid-state, nuclear, and particle physics, thereby including most of the topics normally presented in a modern physics course.

### Surgery for Urinary Incontinence Bloomsbury Publishing

Offers a coherent strategy for ending oil dependence, starting with the United States but applicable worldwide. There are many analyses of the oil problem. This synthesis is the first roadmap of the oil solution, one led by business for profit, not dictated by government for reasons of ideology. This roadmap is independent, peer-reviewed, written for business and military leaders, and co-funded by the Pentagon. It combines innovative technologies and new business models with uncommon public policies: market-oriented without taxes, innovation-driven without mandates, not dependent on major (if any) national legislation, and designed to support, not distort, business logic.

### **Theory, Formulations and Chemical Process Applications** Saunders

This book presents general methods for the design of economic model predictive control (EMPC) systems for broad classes of nonlinear systems that address key theoretical and practical considerations including recursive feasibility, closed-loop stability, closed-loop performance, and computational efficiency. Specifically, the book proposes: Lyapunov-based EMPC methods for nonlinear systems; two-tier EMPC architectures that are highly computationally efficient; and EMPC schemes handling explicitly uncertainty, time-varying cost functions, time-delays and multiple-time-scale dynamics. The proposed methods employ a variety of tools ranging from nonlinear systems analysis, through Lyapunov-based control techniques to nonlinear dynamic optimization. The applicability and performance of the proposed methods are demonstrated through a number of chemical process examples. The book presents state-of-the-art methods for the design of economic model predictive control systems for chemical processes. In addition to being mathematically rigorous, these methods accommodate key practical issues, for example, direct optimization of process economics, time-varying economic cost functions and computational efficiency. Numerous comments and remarks providing fundamental understanding of the merging of process economics and feedback control into a single framework are included. A control engineer can easily tailor the many detailed examples of industrial relevance given within the text to a specific application. The authors present a rich collection of new research topics and references to significant recent work making Economic Model Predictive Control an important source of information and inspiration for academics and graduate students researching the area and for process engineers interested in applying its ideas.

### Compositionality and Concepts in Linguistics and Psychology The Car Hacker's Handbook A Guide for the Penetration Tester

Discusses a range of philosophical questions about fictional characters and fictional objects, with

implications for metaphysics, the philosophy of mind, and the philosophy of language.

In recent years, the number of conflicts related to the misuse of street art and graffiti has been on the rise around the world. Some cases involve claims of misappropriation related to corporate advertising campaigns, while others entail the destruction or 'surgical' removal of street art from the walls on which they were created. In this work, Enrico Bonadio brings together a group of experts to provide the first comprehensive analysis of issues related to copyright in street art and graffiti. Chapter authors shed light not only on the legal tools available in thirteen key jurisdictions for street and graffiti artists to object to unauthorized exploitations and unwanted treatments of their works, but also offer policy and sociological insights designed to spur further debate on whether and to what extent the street art and graffiti subcultures can benefit from copyright and moral rights protection.

**The Car Hacker's Handbook** Oxford University Press, USA

'Intelligent Vehicle Technologies' covers the growing field of intelligent technologies, from intelligent control systems to intelligent sensors. Systems such as in-car navigation devices and cruise control are already being introduced into modern vehicles, but manufacturers are now racing to develop systems such as 'smart' cruise control, on-vehicle driver information systems, collision avoidance systems, vision enhancement and roadworthiness diagnostics systems. aimed specifically at the automotive industry packed with practical examples and applications in-depth treatment written in a text book style (rather than a theoretical specialist text style)

Although transgender persons have been present in various societies throughout human history, it is only during the last several years that they have become widely acknowledged in our society and their right to quality medical care has been established. In the United States, endocrinologists have been providing hormonal therapy for transgender individuals for decades; however, until recently, there has been only limited literature on this subject, and non-endocrine aspects of medical care for transgender individual have not been well addressed in the endocrine literature. The goal of this volume is not only to address the latest in hormonal therapy for transgender individuals (including pediatric and geriatric age groups), but also to familiarize the reader with other aspects of transgender care, including primary and surgical care, fertility preservation, and the management of HIV infection. In addition to medical issues, psychological, social, ethical and legal issues pertinent to transgender individuals add to the complexities of successful treatment of these patients. A final chapter includes extensive additional resources for both transgender patients and providers. Thus,

an endocrinologist providing care to a transgender person will be able to use this single resource to address most of the patient's needs. While Transgender Medicine is intended primarily for endocrinologists, this book will be also useful to primary care physicians, surgeons providing gender-confirming procedures, mental health professionals participating in the care of transgender persons, and medical residents and students.

"How much money do I really need in order to have everything I could possibly want?" In this book, Mark Morgan Ford answers that question - and it's a lot less than you might think. In Part I of the book, he explores many ways to live rich on a budget. The claim he makes over and over again is simple: It is possible to enjoy the best things in life for a fraction of the money that multimillionaires and billionaires spend on the same quality products and services. Then, in Part II, he argues that, although luxurious things comprise a part of living rich, the bigger and more important part is how you spend your time. He points out that we all - billionaires and minimum-wage workers alike - have the same allotment. We are all given 24 hours a day. How we fill that time, he says, is the most important factor in determining the richness of our experience. By the time you finish the book, you will be convinced that this is true for you. And you will know exactly how to start living each of your 24 hours as richly and as freely as a billionaire.

Modern cars are more computerized than ever. Infotainment and navigation systems, Wi-Fi, automatic software updates, and other innovations aim to make driving more convenient. But vehicle technologies haven't kept pace with today's more hostile security environment, leaving millions vulnerable to attack. The Car Hacker's Handbook will give you a deeper understanding of the computer systems and embedded software in modern vehicles. It begins by examining vulnerabilities and providing detailed explanations of communications over the CAN bus and between devices and systems. Then, once you have an understanding of a vehicle's communication network, you'll learn how to intercept data and perform specific hacks to track vehicles, unlock doors, glitch engines, flood communication, and more. With a focus on low-cost, open source hacking tools such as Metasploit, Wireshark, Kayak, can-utils, and ChipWhisperer, The Car Hacker's Handbook will show you how to: -Build an accurate threat model for your vehicle -Reverse engineer the CAN bus to fake engine signals -Exploit vulnerabilities in diagnostic and data-logging systems -Hack the ECU and other firmware and embedded systems -Feed exploits through infotainment and vehicle-to-vehicle communication systems -Override factory settings with performance-tuning techniques -Build physical and virtual test benches to try out exploits safely If you're curious about automotive security and have the urge to hack a two-ton computer, make The Car Hacker's Handbook your first stop.

God and fictional objects are central topics within philosophy, but rarely do the respective discussions overlap. Until now the two fields have remained independent. Applying the debate about fictional objects to issues of theology for the first time, John-Mark L. Miravalle bridges these two fields and presents a new approach to notions of God, creatures, and existence. Miravalle explains why meinongianism, which holds that certain things can serve as intentional objects with properties,

even though they do not exist, can facilitate talk of nonexistence better than other metaphysical viewpoints, such as platonism, modal realism and pretense-theory. He identifies points of connection between theology and nonexistents and uses meinongianism to buttress the cosmological and ontological arguments for God's existence. As a result he is able to explore fresh solutions to problems of classical theism, from the necessary existence of God and creation ex nihilo to free will and the problem of evil. By revealing how a particular account of fictional objects is especially harmonious with and supportive of the major claims of traditional theism, Miravalle makes a major contribution to theistic metaphysics.

This book investigates the mathematical analysis of biological invasions. Unlike purely qualitative treatments of ecology, it draws on mathematical theory and methods, equipping the reader with sharp tools and rigorous methodology. Subjects include invasion dynamics, species interactions, population spread, long-distance dispersal, stochastic effects, risk analysis, and optimal responses to invaders. While based on the theory of dynamical systems, including partial differential equations and integrodifference equations, the book also draws on information theory, machine learning, Monte Carlo methods, optimal control, statistics, and stochastic processes. Applications to real biological invasions are included throughout. Ultimately, the book imparts a powerful principle: that by bringing ecology and mathematics together, researchers can uncover new understanding of, and effective response strategies to, biological invasions. It is suitable for graduate students and established researchers in mathematical ecology.

Intracerebral hemorrhage is a neurovascular emergency associated with high mortality and morbidity. With in-depth reviews of the clinical and biological aspects of the condition, this text provides an up-to-date coverage of this form of stroke. The book covers epidemiology, causes, clinical presentation, management and prognosis, and describes the ongoing research advances

aimed at improving our understanding of the condition. The book fills an existing gap in the medical literature. The chapters discussing the clinical aspects of intracerebral hemorrhage are aimed at the practitioner directing the care of stroke victims. Chapters exploring the biology of pathophysiological events triggered by this disease will provide readers with current data directed to facilitate experimental research in this field of cerebrovascular neurology. It will appeal to clinicians and those with a research interest in cerebrovascular diseases.

**Unreality** Springer

Charles Crittenden here offers an original solution to one of the traditional dilemmas of philosophy—whether there can be any thing not existing, since to say that some thing does not exist seems to presuppose its existence. Drawing on the tools of Wittgensteinian philosophy and speech act theory, Crittenden argues that we can and often do make reference to unreal objects such as fictional characters, though they do not exist in any sense at all.
