Examiner's comments tell you what the examiner is looking for in answers. Both the UK and the EU have pinned much of their climate change policy on the effective operation of the EU emissions trading system (ETS). Now in its second year the scheme has yet to demonstrate that it can deliver the substantial greenhouse gas emission reductions that will form the yardstick of its success. This report examines the proposed revisions to the ETS, which would take effect in the scheme's third trading period, scheduled to last from 2013 to 2020. It is ultimately felt that if the ETS is to live up to its full potential, the aim must be to link it up with emissions trading schemes in other parts of the world so as to make the most of emission reduction opportunities in additional countries and sectors. However, the establishment of such links could prove arduous. It is anticipated that the EU may eventually face stark trade-offs between maintaining the environmental integrity of the ETS and extending its reach. This workshop series is now over ten years old, which is a pretty long time for a very focussed topic: Configuration Management. The first conference took place in 1988 (Grassau,

Germany) and the topics were focussed on version control and rebuilding. Many people consider that SCM is one of the few areas of software engineering that can be considered to be really successful. Products, that more or less fulfill their purpose, exist, and everybody agrees that they are now mandatory for a successful software project. Indeed, during the second half of the nineties, SCM has entered a maturation phase, in which good commercial products have been incorporating many of the features - signed and discussed at previous conferences of this workshop. With the generalization of commercial products, the question now is: What are the objectives of a scientific workshop on this topic? Is there any more research to be done in SCM today? This ninth volume in the series reflects pretty well the current state and mood in the CM community. There are an unprecedented number of papers discussing the current state of the art and trying to identify research directions (session 6). On some core topics, like versioning (session 3), and following SCM8 tracks, papers present work on unified models. Versioning models, after years of raging discussions, now seem to have found a consensus. Medical students often feel they understand the theory behind the clinical aspect of medicine but seldom have enough chance to put what they learn into practice. In addition, clinical examinations pose a challenge to students who may be technically and theoretically excellent, but who have poor examination technique. It is quite common for students to lack understanding of how they will be marked, how much emphasis to place upon certain actions or how much detail is expected of them. 'OSCE CASES WITH MARK SCHEMES' is intended to fill this gap. It provides OSCE mark schemes to reflect the real OSCE experience, by encouraging self assessment when practicing the clinical scenarios. The book includes chapters on communication skills, medical ethics, explanation stations, paediatrics and obstetrics and gynaecology subjects which are sometimes neglected elsewhere. All four authors have taken part in medical student teaching and OSCE examinations. They understand what will earn marks in the actual exam. All the OSCE scenarios are from stations previously examined in the UK's top medical schools. This book prepares the student for what the actual finals exam will be like. CONTENTS: SECTION ONE, COMMUNICATION STATIONS - Presenting Complaints - Psychiatry History Taking - Pediatrics History Taking - Obstetrics History Taking - Gynaecology History Taking - Medical Ethics - Difficult Communication Scenarios - Pharmacology - Consenting - Explanation of Management and Results SECTION TWO, PERFORMANCE STATIONS - Examination Skills - Practical Skills - Data Interpretation - Closing Remarks oscesmart in Medicine Practice vignettes, histories and mark schemes for your finals. Practicing them so much that they become second nature and no longer require thinking. Presented in this book are a range of fifty common scenarios in medicine, divided into acute stations, clinical examinations, data interpretation, practical skills, history taking and communication skills sections. Working through all the cases in this book will not only make you prepared for OSCE stations in medicine but will also make you more confident handling the common clinical scenarios in your future career. oscesmart revision series have been devised to aid your preparation for medical school OSCEs. Complete with - -Student vignettes -Actor histories -Mark schemes We bring to you an essential revision kit that will help you - -Prepare with premade scenarios -Practice in small groups in a timed setting -Use our refined mark schemes to improve your performance Schemes of arrangement are an important and flexible mechanism, which can be used to reorganise a company's capital. Schemes have undergone a renaissance over the last twenty years, particularly as a debt restructuring device in the aftermath of the 2008 financial crisis when companies and their advisors have needed to develop effective tools for dealing with financial distress. The COVID-19 pandemic has provided a further incentive for jurisdictions to ensure that they have an effective debt restructuring mechanism in place. Schemes have also become the mechanism of choice for recommended takeovers. This book performs a critical, contextual and comparative analysis of schemes and their uses, examines recent developments in this area, including the Corporate Insolvency and Governance Act 2020, and considers whether further reform is needed to ensure that schemes continue to develop as an indispensable tool for companies for the future. CAD is considered in this book as a discipline that provides the required know-how in computer hardware and software, in systems analysis and in engineering methodology for specifying, designing, implementing, introducing, and using computer based systems for design purposes. The first chapter gives an impression of the book as a whole, and following chapters deal with the history and the components of CAD, the process aspect of CAD, CAD architecture, graphical devices and systems, CAD engineering methods, CAD data transfer, and application examples. The flood of new developments in the field and the success of the first edition of this book have led the authors to prepare this completely revised, updated and extended second edition. Extensive new material is included on computer graphics, implementation methodology and CAD data transfer; the material on graphics standards is updated. The book is aimed primarily at engineers who design or install CAD systems. It is also intended for students who seek a broad fundamental background in CAD. This book introduces new models based on R-calculus and theories of belief revision for dealing with large and changing data. It extends R-calculus from first-order logic to propositional logic, description logics, modal logic and logic programming, and from minimal change semantics to subset minimal change, pseudo-subformula minimal change and deduction-based minimal change (the last two minimal changes are newly defined). And it proves soundness and completeness theorems with respect to the minimal changes in these logics. To make R-calculus computable, an approximate R-calculus is given which uses finite injury priority method in recursion theory. Moreover, two applications of R-calculus are given to default theory and semantic inheritance networks. This book offers a rich blend of theory and practice. It is suitable for students, researchers and practitioners in the field of logic. Also it is very useful for all those who are interested in data, digitization and correctness and consistency of information, in modal logics, non monotonic logics, decidable/undecidable logics, logic programming, description logics, default logics and semantic inheritance networks.
