ASHRAE Research Project 849. Solar cooling systems can be a cost-effective and environmentally attractive air-conditioning solution. The design of such systems, however, is complex. Research carried out under the aegis of the International Energy Agency's Solar Heating and Cooling Program has shown that there is a range of seemingly subtle design decisions that can impact significantly on the performance of solar cooling systems. In order to reduce the risk of errors in the design process, this guide provides detailed and very specific engineering design information. It focuses on case study examples of installed plants that have been monitored and evaluated over the last decade. For three successful plants the design process is described in detail and the rationale for each key design decision is explained. Numerical constraints are suggested for the sizing / selection parameters of key equipment items. Moreover, the application conditions under which the system selection is appropriate are discussed. By following The Guide for any of the three specific solar cooling systems, the designer can expect to reliably achieve a robust, energy-saving solution. This book is intended as a companion to the IEA Solar Cooling Handbook which provides a general overview of the various technologies as well as comprehensive advice to enable engineers to design their own solar cooling system from first principles. Hotels rely on efficient HVAC systems to ensure the comfort of their guests. HVAC (Heating, Ventilation, and Air Conditioning) systems are used to control the temperature, humidity, and air quality of a hotel's interior environment. By regulating a hotel's indoor environment, HVAC systems help to create a more comfortable and healthy atmosphere for guests. Hotels typically use a combination of heating and cooling systems to maintain the desired temperature in each room. Heating systems like furnaces, boilers, and heat pumps are used to warm the air during colder months, while cooling systems like air conditioners and evaporative coolers are used to cool the air in warmer

months. In addition, ventilation systems are used to bring in fresh outdoor air and filter out airborne pollutants. HVAC systems in hotels must be designed and maintained to meet the specific needs of the hotel. Factors such as the size of the hotel, the number of rooms, and the climate of the local area all need to be taken into account when designing an HVAC system. It is also important to ensure that the HVAC system is energy-efficient, as this can help reduce both energy costs and the hotel's environmental impact. Hotels also rely on HVAC systems to filter out airborne pollutants, such as dust, pollen, and other allergens. Air filters and purifiers help to clean the air of these particles, helping to reduce the risk of guests developing allergies or other respiratory illnesses. Finally, the HVAC system in a hotel plays an important role in controlling humidity levels. Low humidity levels can cause guests to feel uncomfortable or even sick, while high humidity levels can lead to mold and mildew growth. By regulating humidity levels, HVAC systems help to create a more comfortable and healthy environment for guests. The benefits and technical aspects of low - temperature heating. Design procedure for designer and installer. Appendices. This 4-color, hardback book is an easy-to-read, user-friendly manual aimed at HVAC designers concerned with humidity control. It helps to define the purpose of a humidity control project, and provides information on the effects of humidity on mold, mildew, bacteria, viruses and overall human health and comfort. The text also discusses how humidity control equipment works and the importance of managing air pressure in a building. Schools, office buildings, nursing homes and laboratories are discussed in depth along with other types of buildings. The book provides checklists to help architects, owners, contractors and building and HVAC system designers get the job done quickly and accurately. ASHRAE Research Project 1047. A unique and revolutionary text which explains the principles behind the LT Method (2.1), a manual design tool developed in Cambridge by the BRE. The LT Method is a unique way of estimating the combined energy usage of lighting, heating, cooling and ventilation systems, to enable the designer to make comparisons between options at an early, strategic stage. In addition, Energy and Environment in Architecture the book deals with other environmental issues such as noise, thermal comfort and natural ventilation design. A variety of case studies provide a critique of real buildings and highlight good practice. These topics include thermal comfort, noise and natural ventilation.
