 The Digital Transformation of Mental Healthcare

The main objective in the rehabilitation of people following amputation is to restore or improve their functioning, which includes their return to work. Full-time employment leads to beneficial health effects and being healthy leads to increased chances of full-time employment (Ross and Mirowsky

1995). Employment of disabled people enhances their self-esteem and reduces social isolation (Dougherty 1999). The importance of returning to work for people following amputation therefore has to be considered. Perhaps the first article about reemployment and problems people may have at work after amputation was published in 1955 (Boynton 1955). In later years, there have been sporadic studies on this topic. Greater interest and more studies about returning to work and problems people have at work following amputation arose in the 1990s and has continued in recent years (Burger and Marinc 2007). These studies were conducted in different countries on all the five continents, the greatest number being carried out in Europe, mainly in the Netherlands and the UK (Burger and Marinc 2007). Owing to the different functions of our lower and upper limbs, people with lower limb amputations have different activity limitations and participation restrictions compared to people with upper limb amputations. Both have problems with driving and carrying objects. People with lower limb amputations also have problems standing, walking, running, kicking, turning and stamping, whereas people with upper limb amputations have problems grasping, lifting, pushing, pulling, writing, typing, and pounding (Giridhar et al. 2001).

A pointed look at the state of tech-based mental healthcare and what we must do to change it Proponents of technology trumpet it as the solution to the massive increase in the mental distress that confronts our nation. They herald the arrival of algorithms, intelligent chatbots, smartphone applications, telemental healthcare services, and more—but are these technological fixes really as good as they seem? In *Therapy Tech*, Emma Bedor Hiland presents the first comprehensive study of how technology has transformed mental healthcare, showing that this revolution can't deliver what it promises. Far from providing a solution, technological mental healthcare perpetuates preexisting disparities while relying on the same failed focus on personal responsibility that has let us down before. Through vivid, in-depth case studies, *Therapy Tech* reveals these problems, covering issues including psychosurveillance on websites like Facebook and 7 Cups of Tea, shortcomings of popular AI “doctors on demand” like Woebot, Wysa, and Joy, and even how therapists are being conscripted into the gig economy. Featuring a vital coda that brings *Therapy Tech* up to date for the COVID era, this book is the first to give readers a large-scale analysis of mental health technologies and the cultural changes they have enabled. Both a sobering dissection of the current state of mental health and a necessary warning of where things are headed, *Therapy Tech* makes an important assertion about how to help those in need of mental health services today.

Maintaining dignity for patients approaching death is a core principle of palliative care. Dignity therapy, a psychological intervention developed by Dr. Harvey Max Chochinov and his internationally lauded research group, has been designed specifically to address many of the psychological, existential, and spiritual challenges that patients and their families face as they grapple with the reality of life drawing to a close. In the first book to lay out the blueprint for this unique and meaningful intervention, Chochinov addresses one of the most important dimensions of being human. Being alive means being vulnerable and mortal; he argues that dignity therapy offers a way to preserve meaning and hope for patients approaching death. With history and foundations of dignity in care, and step by step guidance for readers interested in implementing the program, this volume illuminates how dignity therapy can change end-of-life experience for those about to die - and for those who will grieve their passing.

When one considers broadband, the Internet immediately springs to mind. However, broadband is impacting society in many ways. For instance, broadband networks can be used to deliver healthcare or community related services to individuals who don't have computers, have distance as an issue to contend with, or don't use the internet. Broadband can support better management of scarce energy resources with the advent of smart grids, enables improved teleworking capacity and opens up a world of new entertainment possibilities. Yet scholarly examinations of broadband technology have so far examined adoption, usage, or diffusion but missed exploring the capacity of broadband networks to enable new applications, the management aspects of funding and developing broadband-enabled services, or the policy environment in which such networks are developed. This book explores a wide range of issues associated with the deployment and use of broadband including its impacts on individuals, organizations, and society, and offers a generalist understanding of the technical aspects of broadband. Management of Broadband Technology and Innovation offers insights on broadband from the perspectives of Information Systems, Management, Strategy, and Communications Policy scholars, drawing on research from these disciplines to inform diverse aspects of broadband deployment, policy, and use. Issues associated with a subject technical in nature, but now researched in many ways, are emphasized. This book explains various softer aspects of broadband deployment and use, focusing on the benefits of broadband rather than on details of the technology.

Digital health and medical informatics have grown in importance in recent years, and have now become central to the provision of effective healthcare around the world. This book presents the proceedings of the 30th Medical Informatics Europe conference (MIE). This edition of the conference, hosted by the European Federation for Medical Informatics (EFMI) since the 1970s, was due to be held in Geneva, Switzerland in April 2020, but as a result of measures to prevent the spread of the Covid19 pandemic, the conference itself had to be cancelled. Nevertheless, because this collection of papers offers a wealth of knowledge and experience across the full spectrum of digital health and medicine, it was decided to publish the submissions accepted in the review process and confirmed by the Scientific Program Committee for publication, and these are published here as planned. The 232 papers are themed under 6 section headings: biomedical data, tools and methods; supporting care delivery; health and prevention; precision medicine and public health; human factors and citizen centered digital health; and ethics, legal and societal aspects. A 7th section deals with the Swiss personalized health network, and section 8 includes the 125 posters accepted for the conference. Offering an overview of current trends and developments in digital health and medical informatics, the book provides a valuable information resource for researchers and health practitioners alike.

The vast, and vastly influential, American military machine has been aided and abetted by cinema since the earliest days of the medium. The US military realized very quickly that film could be used in myriad ways: training, testing, surveying and mapping, surveillance, medical and psychological management of soldiers, and of course, propaganda. Bringing together a collection of new essays, based on archival research, Wasson and Grievson seek to cover the complex history of how the military deployed cinema for varied purposes across the long twentieth century, from the incipient wars of US imperialism in the late nineteenth century to the ongoing War on Terror. This engagement includes cinema created and used by and for the military itself (such as training films), the codevelopment of technologies (chemical, mechanical, and digital), and the use of film (and related mass media) as a key aspect of American "soft power," at home and around the world. A rich and timely set of essays, this volume will become a go-to for scholars interested in all aspects of how the military creates and uses moving-image media.
