Technology** CRC Press  
This first  
comprehensive

overview of reactive  
extrusion technology  
for over a decade  
combines the views of  
contributors from both  
academia and industry  
who share their  
experiences and  
highlight possible

applications and markets. They also provide updated information on the underlying chemical and physical concepts, summarizing recent developments in terms of the material and machinery used. As a result, readers will find here a compilation of potential applications for reactive extrusion to access new and cost-effective polymeric materials, while using existing compounding machines.

*Comparative Study of Mixing in Twin Screw Extruders Using the Boundary Element Method* Green & White Pub

This volume deals with manufacturing processes for preparing very thin polymer products. Many professionals working

on polymer films have requested that a newer version of *Film Processing* be published that includes more recent technologies and addresses the latest literature. *Film Processing Advances* provides a timely response to these requests. This edition is still a technically oriented book to be used by film processing professionals, graduate students, and researchers and it covers recent technologies of film extrusion, extruder screw design, die design, film structure, film temperature, crystallization dynamics, and film properties. Furthermore, *Film Processing Advances* focuses on multilayered films and

recent developments relating to high performance films. The chapters in this edition are all essentially new and were designed to complement the materials found in *Film Processing*, which remains a relevant and important information resource.

GmbH Co KG

Combining the science of foam with the engineering of extrusion processes, *Foam Extrusion: Principles and Practice* delivers a detailed discussion of the theory, design, processing, and application of degradable foam extraction. In one comprehensive volume, the editors present the collective expertise of leading

academic, research, and industry specialists while laying the scientific foundation in such a manner that the microscopic transition from a nucleus to a void (nucleation) and macroscopic movement from a void to an object (formation) are plausibly addressed. To keep pace with significant improvements in foam extrusion technology, this Second Edition: Includes new chapters on the latest developments in processing/thermal management, rheology/melt strength, and biodegradable and sustainable foams. Features extensive updates to chapters on extrusion equipment, blowing agents, polyethylene terephthalate (PET)

foam, and microcellular innovation. Contains new coverage of cutting-edge foaming mechanisms and technology, as well as new case studies, examples, and figures. Capturing the interesting evolution of the field, *Foam Extrusion: Principles and Practice, Second Edition* provides scientists, engineers, and product development professionals with a modern, holistic view of foam extrusion to enhance research and development and aid in the selection of the optimal screw, die design, and foaming system.

*Solid-State Shear Pulverization* iSmithers Rapra Publishing  
This report has the objective of bringing together information

from a broad spectrum of polymer and pipe supply technology and relating it to the regional and demographic trends of the demand side. This approach will enable readers to view their own more detailed market information within a broader context and consequently gain a more complete understanding of long term trends.

Co-rotating screws and/or extruders are used in many branches of industry for producing, preparing and/or processing highly viscous materials. They find a wide variety of applications especially in the plastics, rubber and food industries. Co-rotating twin-screw

machines usually have modular configurations and are thus quite flexible for adapting to changing tasks and material properties. Well-founded knowledge of machines, processes and material behavior are required in order to design twin-screw extruder for economically successful operations. This book provides basic engineering knowledge regarding twin-screw machines; it lists the most important machine-technical requirements and provides examples based on actual practice. Better understanding of the processes is emphasized as this is a prerequisite for optimizing twin-screw designs and operating them efficiently.

Besides basic functions, such as compounding, the book focuses on: - the historical development of twin-screws - the geometry of the screw elements (fundamentals, basic patents, patents overview) - material properties and material behavior in the machine - fundamentals of feed behavior, pressure build-up and power input - examples of applications for various processing tasks - compounding: tasks, applications, processing zones - potential and limits of modeling - scaling-up various processes - machine design incl. drives and materials

**Discontinuous Fiber Composites** John Wiley & Sons  
Blowing Agents and

Foaming Processes is now the longest and most successful running conference on this subject, offering strategic insights from industry leaders within this growing market. This event is the prime opportunity to engage with those involved in the manufacturing of blowing agents, foam insulation and packaging, foam extrusion and equipment manufacture. It brings together processors, materials suppliers, resin manufacturers, academics and end-users to discuss latest developments and findings in this area. This year's conference represented a diverse and interactive agenda, with presentations from across the industry

supply chain, a showcase of innovative foamed products and an exclusive live demonstration of injection moulding technology. These proceedings cover all the presentations from the two day event which illustrated the dynamic and progressive nature of this industry pushed by a challenging market with substantial and evolving requirements. [Compatibilization of Polymer Blends](#)  
Elsevier  
Compatibilization of Polymer Blends: Micro and Nano Scale Phase Morphologies, Interphase Characterization and Properties offers a comprehensive approach to the use of compatibilizers in polymer blends, examining both

fundamental and advanced knowledge in the field. The book begins by introducing polymer blends, describing thermodynamics, miscibility, and phase separation, and explaining the main concepts of compatibilization. Other sections cover theoretical approaches for nearly compatible blends, incompatible blends, nanofillers, physical compatibilization, reactive compatibilization, morphological and structural characterization, and physico-mechanical characterization. Finally, key application areas are covered, including biomedical applications, packaging and automobile engineering. While this

book will be a highly valuable reference source for academics, researchers and postgraduate students interested in polymer blends, it will also be ideal for anyone involved in the fields of polymer science, polymer chemistry, polymer physics, materials science, scientists, R&D professionals, and engineers involved in the development or engineering of polymer products. Offers detailed and systematic coverage of essential and advanced topics relating to the compatibilization of polymer blends. Presents a critical analysis of the effect of compatibilization on morphology and thermal, mechanical, electrical and viscoelastic properties

of polymer blends  
Draws on novel studies  
and state-of-the-art  
research, discussing

This edited volume  
contains the selected  
papers presented at  
the scientific board  
meeting of the German  
Cluster of Excellence  
on "Integrative  
Production Technology  
for High-Wage  
Countries", held in  
November 2014. The  
topical structure of the  
book is clustered in six  
sessions: Integrative  
Production Technology,

Individualised  
Production, Virtual  
Production Systems,  
Integrated  
Technologies, Self-  
Optimising Production  
Systems and Human  
Factors in Production  
Technology. The  
Aachen perspective on  
a holistic theory of  
production is  
complemented by  
conference papers  
from external leading  
researchers in the  
fields of production,  
materials science and  
bordering disciplines.  
The target audience  
primarily comprises  
research experts and  
practitioners in the  
field but the book may  
also be beneficial for  
graduate students.

industry information in

business journals.  
*Frontiers in the Science and Technology of Polymer Recycling* Carl Hanser Verlag GmbH Co KG  
 From the Preface This book is the first extended look at a new and multifaceted polymer processing technology that has already been discussed in numerous articles. Called Solid-State Shear Pulverization (S3P), this innovative process produces polymeric powders with unique physical properties not found in the output of conventional size-reduction methods.... This technology, which utilizes a pulverizer based on a modified co-rotating twin-screw extruder..., has profound implications for both the creation of new polymer blends

and recycling of plastic and rubber waste. Unlike [earlier processes] where polymers are melted prior to pulverization, ...pulverizing mixtures of polymers with the S3P process...does not involve melting. By contrast, S3P maintains polymers in the solid state and avoids the additional heat history that occurs during [other processes], which can be detrimental to the physical properties of pulverized materials. The research and development of the S3P technology...has grown significantly since 1990 from the development of a new plastics recycling process to a much broader polymer processing method that allows intimate mixing of polymers

with very different viscosities, solid-state dispersion of additives, including pigments, and continuous production of powder with unique shapes and larger surface areas. Polymeric powders are of growing importance to plastics processors due to the increase use of plastics in various applications, such as rotational molding, powder coatings, and compounding, which require powder as the feedstock. ...[I]t has become clear that this process allows for in-situ compatibilization of dissimilar polymers by applying mechanical energy to cause chemical reactions. This aspect of S3P technology that we describe in this book should [be useful in] developing new

polymer blends with the use of pre-made compatibilizing agents. In addition, it has been discovered that S3P efficiently mixes polymer blends with different component viscosities, resulting in the elimination of phase inversion. The S3P process directly produces blends with matrix and dispersed phase morphology like those obtained after phase inversion during a long melt-mixing process. This phenomenon is of practical importance because a long processing time is required by conventional melt-mixing to produce a stable blend morphology. S3P is also advantageous for producing thermoplastic or thermoset powder-

coating compounds in a one-step process as opposed to a conventional multi-step operation that involves melt extrusion followed by batch grinding. The major capabilities of this new process can be summarized as follows:

- o Continuous powder production from plastics or rubber feedstocks
- o Blending of immiscible polymers
- o Efficient mixing of polymers with unmatched viscosities
- o Environmentally friendly recycling of multicolored, commingled plastics waste
- o Solid-state dispersion of heat-sensitive additives
- o Engineered plastic/rubber blends

Materials and processes well illustrated. The text is well illustrated with 60

micrographs, diagrams and others figures.

Here is a small sampling of the captions of these figures.

- o Particle-size distribution for virgin LDPE powder made with PT-25 pulverizer
- o Optical photograph of virgin LDPE powder made with PT-25 pulverizer
- o Layout for a three-stage rubber pulverizer
- o Flow chart for powder coating production by conventional process and with new S3P technology
- o SEM image of pulverized virgin PP at 40X (first in series of SEM images of polymer powders)
- o Optical micrograph of melt-crystallized thin films of unpulverized virgin PP under polarized light
- o Log of viscosity vs. log shear rate for virgin HDPE after S3P processing

Gel permeation chromatograms (GPC) of polystyrene subjected to S3P processing Color-photo section One of the several functions of Solid-State Shear Pulverization technology is recycling mixed plastic waste. This section of twenty full-color photographs and micrographs illustrates different processed materials, as well as the machinery and mixed waste used. Here is a small sampling of the photo and micrograph captions. o Resultant flake feedstock from granulation o S3P-made uniform powder from feedstock o Flake feedstock of post-consumer HDPE/PP blend (90/10 ratio) o Injection-molded test bar (with translucence) made from S3P powder

without pelletization o Injection-molded test bar made from S3P powder without pelletization showing uniform color o Several test bars subjected to tensile testing showing exceptionally high elongation at break Useful reference data in tables More than 60 tables provide useful data in convenient form. Here is a small sampling of table captions. o Physical properties of virgin PP 8020 GU injection-molded from S3P-made powder (first in series of tables on physical properties of various plastics processed from S3P-made powder) o Sieve analysis of powder resulting from S3P of virgin LDPE 509.48 (one of series of tables on sieve analysis of polymer powders) o

Melt-flow rate before and after S3P processing for virgin PS and two PP samples o Key physical properties of injection-molded post-consumer polyolefin blends pulverized by S3P process The Authors Klementina Khait, M.S. Ch.E., Ph.D., is Research Associate Professor and Director of the Polymer Technology Center in the Department of Chemical Engineering, Northwestern University. Her industrial experience in polymer science and engineering includes work with Borg-Warner Chemicals and Quantum Chemical Corporation. She received her two advanced degrees, in chemical engineering and polymer chemistry, from the

Technological Institute, St. Petersburg, Russia. Dr. Khait holds several patents and has published more than 50 papers in scientific and technical journals. Stephen Carr, Ph.D., is Professor of Materials Science and Engineering and Chemical Engineering at Northwestern University. His industrial work includes work in polymer science and engineering with General Motors Corp. He received a doctorate in polymer science from Case Western Reserve University. He has been on the Northwestern University faculty since 1969. Martin H. Mack is Vice President for R&D with the Berstorff Division of Krauss-Maffei Corporation. He

holds an engineering degree from the University of Stuttgart. He has served for more than ten years on the Board of Directors of the Society of Plastics Engineers (SPE).

Routledge

Lithium-ion batteries (LIBs), as a key part of the 2019 Nobel Prize in Chemistry, have become increasingly important in recent years, owing to their potential impact on building a more sustainable future. Compared with other batteries developed, LIBs offer high energy density, high discharge power, and a long service life. These characteristics have facilitated a remarkable advance of LIBs in many frontiers, including electric vehicles, portable and

flexible electronics, and stationary applications. Since the field of LIBs is advancing rapidly and attracting an increasing number of researchers, it is necessary to often provide the community with the latest updates. Therefore, this book was designed to focus on updating the electrochemical community with the latest advances and prospects on various aspects of LIBs. The materials presented in this book cover advances in several fronts of the technology, ranging from detailed fundamental studies of the electrochemical cell to investigations to better improve parameters related to battery packs.

*Co-Rotating Twin-*

*Screw Extruder* William Andrew

A complete and timely overview of the topic, this volume imparts knowledge of fundamental principles and their applications for academicians, scientists and researchers, while informing engineers, industrialists and entrepreneurs of the current state of the technology and its utilization. Each article is uniformly structured for easy navigation, containing the latest research & development and its basic principles and applications, examples of case studies, laboratory and pilot plant experiments, as well as due reference to the published and patented literature.

*United States* Smithers Rapra

Understanding the properties of polymer carbon nanotube (CNT) composites is the key to these materials finding new applications in a wide range of industries, including but not limited to electronics, aerospace and biomedical/bioengineering. Polymer-carbon

nanotube composites provides comprehensive and in-depth coverage of the preparation, characterisation, properties and applications of these technologically interesting new materials. Part one covers the preparation and processing of composites of thermoplastics with CNTs, with chapters covering in-situ polymerization, melt processing and CNT surface treatment, as well as elastomer and thermoset CNT composites. Part two concentrates on properties and characterization, including chapters on the quantification of CNT dispersion using microscopy techniques, and on topics as diverse as thermal

degradation of polymer/CNT composites, the use of rheology, Raman spectroscopy and multi-scale modelling to study polymer/CNT composites, and CNT toxicity. In part three, the applications of polymer/CNT composites are reviewed, with chapters on specific applications such as in fibres and cables, bioengineering applications and conductive polymer CNT composites for sensing. With its distinguished editors and international team of contributors, Polymer-carbon nanotube composites is an essential reference for scientists, engineers and designers in high-tech industry and academia with an interest in

polymer nanotechnology and nanocomposites. Provides comprehensive and in-depth coverage of the preparation, characterisation and properties of these technologically interesting new materials. Reviews the preparation and processing of composites of thermoplastics with CNTs, covering in-situ polymerization, melt processing and CNT surface treatment. Explores applications of polymer/CNT composites such as in fibres and cables, bioengineering applications and conductive polymer CNT composites for sensing.

*Official Gazette of the United States Patent and Trademark Office*

Encyclopedia of Polymer Blends, Volume 2

This review describes the changes in the industry over the last 5 years, concentrating on the screw extrusion process where the extruded product has a constant cross-section. Film and sheet production and pultrusion are not included in this review. Products and applications are reviewed in detail and major advances such as computer control, materials and speed and size issues are also covered. An additional indexed section containing several hundred abstracts from the Rapra Polymer Library database provides useful references for further reading.

### **Foam Extrusion**

iSmithers Rapra  
Publishing

This comprehensive, long-needed reference provides the thorough understanding required to modify and manipulate rigid PVC's thermal/shear sensitivity and rheological properties, helping you utilize rigid PVC most effectively in manufacturing applications as diverse as pipes, house siding, bottles, window frames, and packaging films. With complete, up-to-the-minute coverage in one convenient source, *Engineering with Rigid PVC* encompasses rheological principles, resin properties, and additive modification, as well as polymer preparation, melt processing, and forming techniques ... major conversion

operations and their manufacturing applications—including actual commercial formulations and processes ... quality control procedures necessary to monitor compounding processes ... aspects of processability critical for product development and improvement ... and much more. International in scope, this time- and money-saver is an essential daily resource for all professionals involved in Engineering with Rigid PVC, including plastics engineers, polymer chemists, process engineers, and plastics processors and technicians. Furthermore, the volume is ideal for training programs and

professional seminars, and is an outstanding supplement for students in polymer chemistry, materials science, and plastics engineering.

### **Plastics Technology**

Springer Science & Business Media  
 Industrial Applications of Renewable Plastics: Environmental, Technological, and Economic Advances provides practical information to help engineers and materials scientists deploy renewable plastics in the plastics market. It explores the uses, possibilities, and problems of renewable plastics and composites to assist in material selection and rejection. The designer's main problems are examined, along with basic reminders that

deal with structures and processing methods that can help those who are generally familiar with metals understand the unique properties of plastic materials. The book offers a candid overview of main issues, including conservation of fossil resources, geopolitical considerations, greenhouse effects, competition with food crops, deforestation, pollution, and disposal of renewable plastics. In addition, an overview of some tools related to sustainability (Life cycle assessments, CO<sub>2</sub> emissions, carbon footprint, and more) is provided. The book is an essential resource for engineers and materials scientists involved in material selection, design,

manufacturing, molding, fabrication, and other links in the supply chain of plastics. The material contained is of great relevance to many major industries, including automotive and transport, packaging, aeronautics, shipbuilding, industrial and military equipment, electrical and electronics, energy, and more. Provides key, enabling information for engineers and materials scientists looking to increase the use of renewable plastic materials in their work Presents practical guidance to assist in materials selection, processing methods, and applications development, particularly for

designers more familiar with other materials, such as metals Includes a candid discussion of the pros and cons of using renewable plastics, considering the technical, economic, legal, and environmental aspects *Encyclopedia of Polymer Blends, Volume 2* Springer Polymers, main components of plastics and rubbers, are being discarded in increasing quantities. But this waste can also be considered as 'plastic gold'. Public concern, coupled with the inherent value of the material, means that recycling is imperative. The present book presents a survey of current knowledge in the form of case studies, including current legal and

educational issues. Topics covered also include regulation and practice in NATO countries, the economics of recycling, the reprocessing of single polymers and mixtures, and future prospects and strategies. Audience:

Vital reading for all polymer scientists, technicians and engineers.
