*Chemistry for the  
Biosciences* S. Chand  
Publishing  
This book focuses on the  
fundamentals of plant  
physiology for  
undergraduate and  
graduate students. It  
consists of 34 chapters  
divided into five major  
units. Unit I discusses the

unique mechanisms of  
water and ion transport,  
while Unit II describes the  
various metabolic events  
essential for plant  
development that result  
from plants' ability to  
capture photons from  
sunlight, to convert  
inorganic forms of  
nutrition to organic forms  
and to synthesize high  
energy molecules, such as  
ATP. Light signal  
perception and  
transduction works in  
perfect coordination with  
a wide variety of plant  
growth regulators in  
regulating various plant

developmental processes, and these aspects are explored in Unit III. Unit IV investigates plants' various structural and biochemical adaptive mechanisms to enable them to survive under a wide variety of abiotic stress conditions (salt, temperature, flooding, drought), pathogen and herbivore attack (biotic interactions). Lastly, Unit V addresses the large number of secondary metabolites produced by plants that are medicinally important for mankind and their

applications in biotechnology and agriculture. Each topic is supported by illustrations, tables and information boxes, and a glossary of important terms in plant physiology is provided at the end.
