At present, no single book adequately  
covers a basic understanding of wood  
book satisfies the need for such a work. It  
describes drying in practice. This the  
fundamental basis of kiln-drying  
technology, to enable forest companies to  
improve their drying operations as high-  
quality timbers become scarcer and of  
yesteryear can no longer be tolerated.  
Adaptive the wasteful practices is no  
longer good enough. Innovations change  
based on past experience of the material  
being dried and the processes require a

sound understanding of drying. Newer  
techniques, such as the use of ultrahigh  
temperature sea soning and superheated  
steam under vacuum, require an even  
greater depth of physical understanding  
for these methods to be used effectively  
and economically. book provides a  
description of modern ideas about wood  
structure, This moisture movement and  
stress development, from which models of  
the drying process are developed to give  
the kiln operator important information  
about the course of drying under specified  
conditions, and thus a means is compared  
with practice wherever for rational process  
improvement. Theory possible.
