The industry's longest-

running publication for  
baseball analysts and  
fantasy leaguers, Ron  
Shandler's Baseball  
Forecaster, published  
annually since 1986, is  
the first book to approach  
prognostication by  
breaking performance  
down into its component  
parts. Rather than  
predicting batting  
average, for instance, this

resource looks at the elements of skill that make up any given batter's ability to distinguish between balls and strikes, his propensity to make contact with the ball, and what happens when he makes contact—reverse engineering those skills back into batting average. The result is an unparalleled forecast of baseball abilities and trends for the upcoming season and beyond.

The second edition of *Physiology of Membrane Disorders* represents an extensive revision and a considerable expansion of the first edition . Yet the purpose of the second edition is identical to that of its predecessor, namely, to provide a rational analysis of membrane transport processes in individual membranes, cells, tissues, and organs, which in turn serves as a frame of reference for rationalizing disorders in which derangements of

membrane transport processes play a cardinal role in the clinical expression of disease. As in the first edition, this book is divided into a number of individual, but closely related, sections. Part V represents a new section where the problem of transport across epithelia is treated in some detail. Finally, Part VI, which analyzes clinical derangements, has been enlarged appreciably. THE EDITORS  
xi Preface to the First Edition  
The purpose of this book is to provide the

reader with a rational frame of reference for assessing the pathophysiology of those disorders in which derangements of membrane transport processes are a major factor responsible for the clinical manifestations of disease. In the present context, we use the term "membrane transport to refer to those molecular processes whose cardinal function, broadly speaking, is processes" in a catholic sense, the vectorial transfer of molecules-either

individually or as ensembles-across biological interfaces, the latter including those interfaces which separate different intracellular compartments, the cellular and extracellular compartments, and secreted fluids-such as glomerular filtrate-and extracellular fluids.

Many clinical problems of transport have been known for decades, particularly those disorders involving the liver and kidney. As a result of the dramatic increase in interest in transport at the membrane level the Society devoted its

Seventeenth Symposium, held at Leeds during September 1979, to Transport and Inherited Disease, the result of that meeting forming the basis of this monograph. For the occasion over a hundred members and guests of the Society were joined by many invited speakers from Europe and the USA to discuss this rapidly developing field with special reference to the direct interests of the Society - in inherited metabolic disease. The major theme of the meeting was opened with

formal scientific presentations on membrane structure, synthesis and the regulation of epithelial transport. These were followed by discussions of specific problems of transport in brain, kidney and red blood cells. Almost all of these later lectures had clinical applications with cystic fibrosis and nephrogenic diabetes insipidus featuring as examples of the common inherited diseases. The Hudson Memorial Lecture was delivered by Professor H.

Bickel (Heidelberg). This outstanding review lecture on 'Phenylketonuri- past, present and future' is reproduced in the Journal of the Society - the Journal of Inherited Metabolic Disease (Volume 3 No.4, pp.123-132). xiii xiv  
PREFACE The members' papers (both oral and poster) are also being reprinted in various issues of the Journal (published by MTP Press Ltd., Lancaster, UK).

Completely updated to reflect current practice, the 3rd edition of this comprehensive resource provides a multi-disciplinary, in-depth review of the physiology of continence, the pathologic mechanisms producing incontinence, and current treatment options for the various types of incontinence. Assessment, behavioral therapies, and

multidisciplinary care are emphasized as key elements in the treatment and management of incontinence. In addition to the life-span content discussed throughout the book, an entire chapter is devoted to bowel and bladder management in children. Authored and contributed by leaders in the Wound, Ostomy and Continence Nurses Society (WOCN). Provides an in-depth review of the physiology of continence, the pathologic mechanisms producing incontinence, and current

treatment options to facilitate optimal assessment and care. Features detailed assessment guidelines to help clinicians accurately identify causative and contributing factors, and implement of a comprehensive management plan. Discusses urinary incontinence and fecal incontinence in separate sections to address the special considerations for each in an organized, focused, easy-to-use format. Features individual, complete

chapters for each of the following types of incontinence: stress, functional, reflex (neurogenic bladder), and overactive bladder (urge incontinence). Devotes separate chapters to Pathology & Management of Postprostatectomy Incontinence and Bowel and Bladder Management in Children to ensure comprehensive coverage of these topics. Offers life-span content to help clinicians provide appropriate care for patients in every stage of life. Includes self-

assessment questions with answers and rationales for review and self-testing. Integrates multidisciplinary care throughout to highlight its importance in successful treatment. Features a new chapter on Pathology & Management of Postprostatectomy Incontinence that provides detailed information on this increasingly important aspect of incontinence. Includes content on the impact of spinal cord injury on bladder and bowel function.

This book presents a one-stop reference to the empirical correlations used extensively in geotechnical engineering. Empirical correlations play a key role in geotechnical engineering designs and analysis. Laboratory and in situ testing of soils can add significant cost to a civil engineering project. By using appropriate empirical correlations, it is possible to derive many design parameters, thus limiting our reliance on these soil tests. The

authors have decades of experience in geotechnical engineering, as professional engineers or researchers. The objective of this book is to present a critical evaluation of a wide range of empirical correlations reported in the literature, along with typical values of soil parameters, in the light of their experience and knowledge. This book will be a one-stop-shop for the practising professionals, geotechnical researchers and academics looking for specific correlations for

estimating certain geotechnical parameters. The empirical correlations in the forms of equations and charts and typical values are collated from extensive literature review, and from the authors' database.

The application of evidence-based veterinary medicine (EBVM) can assist in improving and optimising the diagnosis, prognosis, control, treatment and ultimately the welfare of animals. It can also provide the user with a methodology for appropriate, patient orientated life-long, self-directed, learning. To practise evidence-based veterinary medicine we require a range of skills that we may not have.

This book will explain what evidence-based veterinary medicine is and show how it can be applied to veterinary practice to improve the quality of care for patients and provide informed choices for owners. It will provide the reader with a toolkit of skills necessary to practise evidence-based veterinary medicine. The authors explain how to:

- Transform information needs into a series of clinical questions that can be answered
- Search for best available external

evidence · Critically appraise the evidence for its validity and importance · Apply the results in clinical practice · Understand the process of diagnosis and use of clinical diagnostic decision support systems · Perform a decision analysis This book is aimed at practitioners but will be of interest to veterinary surgeons at any stage of their training or career wishing to learn about EBVM. The authors are responsible for devising and teaching an EBVM course at the veterinary

school at Cambridge. Dr Peter Cockcroft, Clinical lecturer, Department of Clinical Veterinary Medicine, University of Cambridge.

Nine years have elapsed since the second edition of this book was published. In this time the principal advances in neuromuscular diseases have been in the application of molecular

genetics to understanding the aetiology and pathogenesis of this group of disorders. As a result many previously unrecognised disorders have been characterised. Some clinical syndromes, such as the limb girdle dystrophies, have become better defined. In many such instances the new genetic information has led to major advances in knowledge of the biology of cell structures, for example, the membrane structural and channel proteins. The clinical syndromes themselves,

and their pathological and electrophysiological characteristics, however, remain as important as ever, since they constitute the clinical problem itself and, indeed, the database from which all other concepts emerge. Knowledge of the pathogenesis, genetics, and molecular biology of neuromuscular disorders is essential both in developing and applying new therapies and preventive measures, and in formulating genetic and prognostic advice. However, this information

does not necessarily always define clinically useful syndromes. Myotonia, for example, is an electrophysiological finding in some syndromes in which it is undetectable by clinical examination, although the phenomenon itself was originally defined as a clinical entity. The limb girdle muscular dystrophy syndromes can be defined by severity, distribution of weakness, age of onset, sex distribution and other characteristics and many of these can be better understood by study of

the underlying defect in cell structural proteins.
