Advance praise for Philip

Plait's Bad Astronomy

"Bad Astronomy is just plain good! Philip Plait clears up

every misconception on astronomy and space you never knew you suffered from." --Stephen Maran, Author of

Astronomy for Dummies

and editor of The Astronomy and Astrophysics Encyclopedia  
"Thank the cosmos for the bundle of star stuff named Philip Plait, who is the world's leading consumer advocate for quality

science in space and on Earth. This important contribution to science will rest firmly on my reference library shelf, ready for easy access the next time an astrologer calls." --Dr. Michael Shermer, Publisher of SKEPTIC magazine, monthly columnist for Scientific American, and author of *The Borderlands of Science* "Philip Plait has given us a readable, erudite, informative, useful, and entertaining book. *Bad Astronomy is Good Science*. Very good science..." --James "The Amazing" Randi, President, James Randi Educational Foundation, and author of *An Encyclopedia of Claims, Frauds, and Hoaxes of the Occult and Supernatural* "Bad Astronomy is a fun read. Plait is wonderfully witty and educational as he debunks the myths, legends, and 'conspiracies' that abound in our society. 'The Truth Is Out There' and it's in this book. I loved it!" --Mike Mullane, Space Shuttle astronaut and author of *Do Your Ears Pop in Space?*

This book examines the ways in which attitudes toward astronomy in Australia, China, India, Indonesia, Japan, South Korea, New Zealand, Taiwan, Thailand and Uzbekistan have changed with the times. The emergence of astrophysics was a worldwide phenomenon during the late nineteenth and early twentieth centuries, and it gradually replaced the older-style positional astronomy, which focused on locating and measuring the movements of the planets, stars, etc.. Here you will find national overviews that are at times followed by case studies of individual notable achievements. Although the emphasis is on the developments that occurred around 1900, later pioneering efforts in Australian, Chinese, Indian and Japanese radio astronomy are also included. As the first book ever published on the early development of astrophysics in Asia, the authors fill a chronological and technological void. Though others have already written about earlier astronomical developments in Asia, and about the recent history

of astronomy in various Asian nations, no one has examined the emergence of astrophysics, the so-called 'new astronomy' in Asia during the late nineteenth and early twentieth centuries. [Opening a New Window on the Universe](#) Saunders College Publishing Home to some of the most remarkable feats of engineering as well as awe-inspiring natural vistas, ancient Egypt was a land of great promise fulfilled. Its pyramids, writing systems, and art all predate the Islamic conquest and are symbols of the civilization's vitality. This volume invites readers to indulge in the splendors of ancient Egyptian culture and discover the traditions that have fired imaginations for generations. A detailed appendix profiles important sites throughout Egypt, many of which still contain remnants and artifacts that illustrate the import of this extraordinary civilization.

This volume is addressed to historians of science, Egyptologists and Assyriologists dealing with the history of early science. It presents the proceedings of two workshops held at the Goethe-University Frankfurt/Main, focusing on traditions of systematic knowledge in Ancient Egypt and Mesopotamia. Assuming that written knowledge was preserved and transmitted intentionally in both cultures, paradigms of knowledge can be reflected by the texts. Although the available source material is subject to their find spots and the vagaries of preservation, by asking specific questions the sources can provide insights into the work of the ancient scholars. The text corpora presented in this volume come from the fields of medicine, magic and ritual, astronomy, mathematics and law. The authors use the sources to provide overviews of the discussed knowledge areas and to discuss certain aspects of the traditions in more detail. *Encyclopædia Americana*

Combining as it does the romance of space with the mystery of the past, the study of pre-Columbian skywatchers of the New World has drawn increasing scientific and popular attention in recent years. Aveni, one of the pioneers in this new interdisciplinary field, couples basic astronomy with archaeological and ethnological data to present a readable and entertaining synthesis of what is known of ancient astronomy in this hemisphere.

This book is an elegant account of the development of the great ancient civilizations of the Near East and how did the knowledge of the people of the Orient spread over the surrounding regions. In a lucid, concise, and well-organized style, the authors provide a clear analysis of how the ancient Near East provided the West with the foundations of

civilization from the domestication of plants and animals through the development of writing, astronomy, mathematics, medicine, law, and industry to the formation of governments, states, and empires. Each of the various aspects of civilization is treated independently, rendering the book an accessible source of information and an easy to use reference book.
